

Management Console integration to external Systems

Blancco Management Console supports data and process integration with external systems by providing web services. These web services provide a few different interfaces where the required data can be queried by using different parameters.

Best efforts are made to provide backward compatibility with integration scripts, but because of added features and new functionality, Blancco cannot provide a strong guarantee for backwards compatibility with all previous versions. Integration to 3rd party applications using direct database queries are not supported and should be avoided. During a version update of BMC, there may be changes applied to the database structure and web services.

Example integration:
